Code system

Swedex code system specifies the composition of the saw blade

- First the hook angle is specified, in this example 6 degrees.
- Negative hook angle is indicated by N, e.g. N2.
- Tooth shape is specified by two or three letters.
- Tooth pitch is the distance between two adjacent teeth.
- Special indicates different features of the saw blade, e.g. T2 states that the saw blade has smaller kerf and SP states that it is a special saw blade.
- Thereafter the diameter is specified (in mm like the other measures).
- Kerf is the width of the TCT tooth.
- Saw body is the thickness of the steel body.
- The centre bore is specified with the general tolerance H7
- No. of teeth is always written after the letter z.

In this catalogue we use the following abbreviations: diameter (D), kerf (B), saw body (b), centre bore (c), no. of teeth (z), wiper slots (RS)

HOOK ANGLE

The hook angle depends on the material, type of cutting and machine type. Some general hook angles for a range of materials are shown below.

Negative 5-10° - crosscutting of wood in pendulum and parallel saws, edge band cutting and trimmer machines using with feed.

Negative 2-5° - cutting of metals with manual feed, plastics and laminates.

6-10° - crosscutting of wood, hard plastics and veneered and laminated boards. Metal sawing with automatic feed.

5-15° - crosscutting of wood. Panel sizing of chipboards, plastics, plywood and veneered boards.

22° - ripping of dry or green wood.

25-30° - ripping and edging of green wood.

TOOTH SHAPE

Tooth shape indicates what kind of top grinding the saw blade has. Here the most common types are shown. Although there are several other types and combinations than the ones listed below.

AA. Straight teeth

For ripping wood, including multirip sawing. Can be used with high feed speeds where an average surface finish is required.

BA. Alternately beveled teeth

For ripping and crosscutting wood. Panel size sawing, e.g. of plywood. Gives good finish.

BAE. Alternately beveled teeth with chamfer

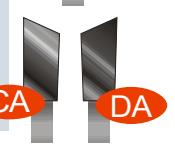

For sawing of thin and hard plastics.

CA. Right hand beveled teeth

DA. Left hand beveled teeth

All teeth are beveled in the same direction. Gives good finish. Used for pre-sawing, scribing, tenoning, and panel sizing.

EA. Trapezoidal teeth

Roughing and finishing teeth. For sawing of coated and non-coated woodblocks e.g. chip-, fibre-, MDF- and HDF-boards. Also suitable for plastic and laminated boards.

EAM. Trapezoidal teeth

EAM for sawing of metal.

RA. Straight teeth with conical sides

Used as a scribing saw blade when fractioning boards, prior to panel sizing.

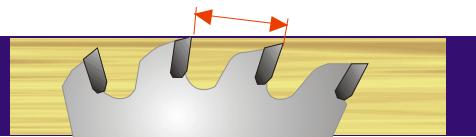

RABA. Alternately beveled teeth with conical sides

EAXH. Alternately straight and inverted V tooth, with hollow ground front

For sawing of varnished and coated boards.

TOOTH PITCH

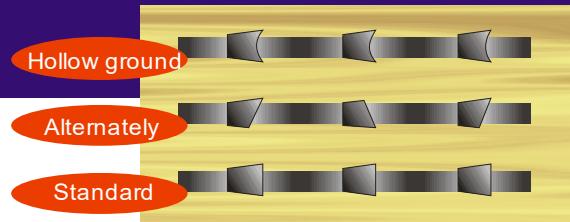

Tooth pitch is an important factor when choosing blades for different types of work. The pitch is the distance between the front faces of adjacent teeth and is given in mm. The formula to the right can be used for calculating the tooth pitch.

$$\text{Tooth pitch} = \frac{\text{Diameter} * \pi}{\text{No. of teeth}}$$

FRONT GRIND

The front of the tooth is straight as standard. To get maximum sharpness and the best cutting performance the teeth can also be alternately beveled or hollow ground.

KEYWAYS & SCREW/PIN HOLES

Screw- and pin holes

Screw holes (FH) and pin holes (PH) are specified by the pitch circle (DC) or "edge to edge" (kk), as shown in the picture to the right.

Example:
2PH6DC80
2PH6kk7
(D=60mm, d=6mm,
DC=80mm)

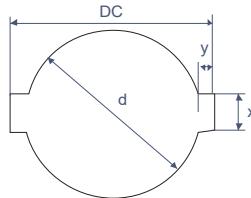

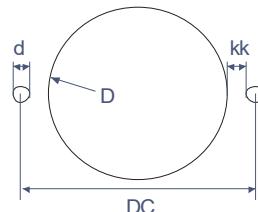

NOTE: If the sawblade only has one pin hole specify "centre / centre" distance between D and d.

For screw holes state Di and the countersunk angle or Dy or screw type (ex. M5). Furthermore, DC should always be stated.

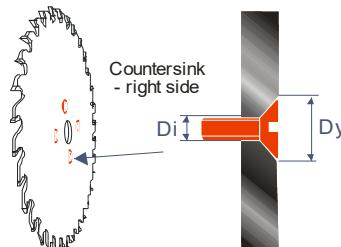

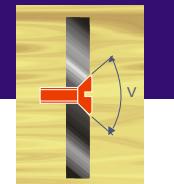

Keyways

When ordering keyways state information about width (x), depth (y) and number of keyways.

Example:
A blade has 2 keyways with width 11mm and depth 6mm.
2ks11x6

When ordering screw holes always state the side of the countersink. Hold the saw blade with the teeth on the top faced towards you as shown in the picture below. The picture shows a right countersink.

Example:
A blade has 4 screw holes, with inner diameter Di=6,0mm, outer diameter Dy=10,0mm and DC=80mm. The countersink is on the right side.
4FH 6,0 Dy=10,0 DC=80 countersink right

$$y = \frac{DC - d}{2}$$

SPECIAL

After tooth pitch "special" is stated. In the table below some common special saw blades are listed. If the saw blade is totally customised the note "sp" is stated.

- B2 = Large kerf
- T2 = Small kerf
- T3 = Extra small kerf
- T4 = Extra small kerf
(with limited cutting depth)
- S = Blade with guard teeth
- R = Wiper slot blade
- SR = Wiper slot blade with guard teeth
- E = Reduced gullet for noise reduction
- L = Laser damped saw body
- BO = Bombastic side grinding

When ordering special saw blades a drawing should if possible be enclosed. If not, please provide the following information:

1. Type of machine
2. Speed (rpm)
3. Feed speed (m/min)
4. Diameter
5. Centre bore
6. Flange diameter
7. Keyways, pin holes, screw holes
8. Wiper slots, open or closed
9. Chip limiter
10. Material to be cut (green or dry)
11. Saw height (mm/blade)
12. Type of cutting edge

INQUIRY SPECIAL SAW BLADE	
This form helps us to optimise the correct saw blade for your needs. You do not need to fill in all lines, but the more information you give us the better possibility we have to make a good solution for you.	
BASIC FACTS	
Are the article no. of the previously saw blade known? (Ex. 2084972 3002.879 30 248 or sp/25)	
Outer dia. mm	(tolerance _____)

Download "Inquiry special saw blade" at:
www.swedex.com

CUTTING SPEED

Generally you should choose a blade with the smallest diameter possible (to maximize the stability) and the smallest kerf possible. At the same time the diameter must be adapted to the machine's speed of revolution to receive the most suitable cutting speed (if the speed of the machine is non-adjustable).

Carbide tipped saw blades require relatively high cutting speeds. The recommended speed for working in wood-based materials is about 70 m/sec.

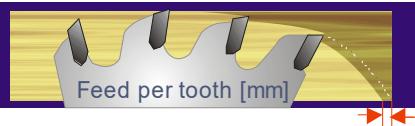

$$\text{Cutting speed} = \frac{\text{Diameter} * \text{RPM} * \pi}{60 * 1000}$$

$$[\text{M/sec}] = \frac{[\text{mm}] * [\text{rpm}] * \pi}{60 * 1000}$$

Material	Cutting speed [m/sec]
Wood:	
cross-cutting	50-80
ripping dry	60-100
ripping green	60-100
saw mill	60-100
Veneered and laminated board	60-80
Fibre board	70-80
Plaster- and chipboard, plywood	50-80
Veneers, cardboard rolls (tubes)	50-80
Hard plastic	50-75
Plexiglas, PVC, bakelite	50-85
Plastic laminates	50-75
Soft plastics	15-50
Aluminium	60-80
Copper	50-70
Brass	50-70
Light concrete	40-60
Steel (not hardened - mild)	5-30

FEED PER TOOTH

To optimize the saw blade's service life and cutting performance the usage of a correct feed per tooth is required. Too low feed speed cause rapid wear of the cutting edge. Too fast feed speed on the other hand could cause teeth to break (as a result of lacking chip pocket volume).

The table shows the recommended feed per tooth for different materials.

You can calculate the feed per tooth using the formula below.

$$\text{Feed per tooth} = \frac{\text{Feed speed} * 1000}{\text{Speed of revolution} * \text{no. of teeth}}$$

$$[\text{mm}] = \frac{[\text{m/min}] * 1000}{[\text{rpm}] * z}$$

Material	Feed per tooth [mm]
Wood:	
cross-cutting	0,10-0,35
ripping dry	0,10-0,20
ripping green	0,20-0,80
saw mill	0,70-1,50
saw mill*	0,80-2,50
Veneered and laminated board	0,05-0,12
Fibre board	0,08-0,25
Plaster- and chipboard, plywood	0,08-0,25
Veneers, cardboard rolls (tubes)	0,08-0,25
Hard plastic	0,05-0,12
Plexiglas, PVC, bakelite	0,05-0,12
Plastic laminates	0,03-0,06
Soft plastics	0,05-0,08
Aluminium	0,02-0,05
Copper	0,03-0,08
Brass	0,03-0,08
Steel (not hardened - mild)	0,01-0,03

GULLET FEED INDEX

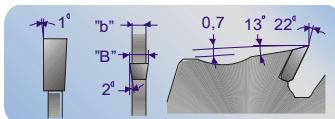

If the feed per tooth is very high the gullet volume needs to be calculated. A small gullet volume leads to an increased risk of cracks. We have developed a Microsoft Excel program for calculating the gullet volume along with other saw data. Contact Swedex technical sales people or one of Swedex resellers for assistance.

Rip Saw Blades with Wiper Slots

22AA46SR

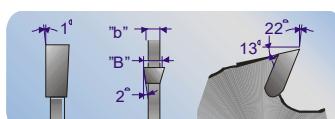

With guard teeth and wiper slots. Diameter 180 to 200mm

D	B	b	z	£
180	2.8	1.9	12+2	128.67
200	2.8	1.9	14+2	128.67
225	3.2	2.2	16+2	128.67
250	3.2	2.2	16+2	129.62
280	3.2	2.2	18+2	136.39
300	3.2	2.2	20+2	144.46
315	3.2	2.2	20+2	147.90
350	3.5	2.5	24+2	161.20
400	3.5	2.5	28+2	181.61

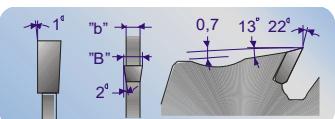

22AA46R

With large gullets and wiper slots. Diameter 225 to 400mm

22AA39SR

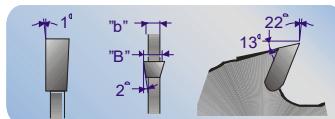

With guard teeth and wiper slots.

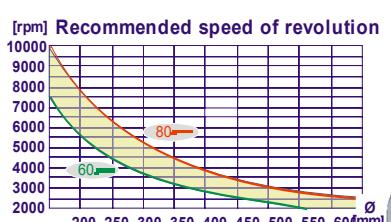

D	B	b	z	£
200	2.0	1.4	16+2	128.67
200	2.5	1.8	16+2	128.67
225	2.0	1.4	18+2	128.67
225	2.5	1.8	18+2	128.67
250	2.5	1.8	20+2	129.62
250	2.8	2.0	20+2	129.62
280	2.8	2.0	22+2	136.39
300	2.8	2.0	24+2	144.46

22AA39R

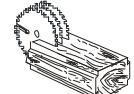

With large gullets and wiper slots. Pin holes for the Raimann machine

D	B	b	z	£
300	3.2	2.2	24+2	159.19
350	3.5	2.5	24+4	215.69

Wiper slot blades are Multi-rip blades. The wiper slots reduce the risk of getting stuck and also of the saw body becoming burnt. The guard tooth throws out loose cuttings and keeps the cutting groove clean. The blades can be used for sawing both green and dry wood.

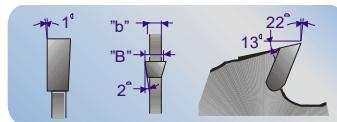

Rip Saw Blades with Wiper Slots-Thin Kerf

22AA46RT2

With large gullets and wiper slots. Diameter 180 to 400mm

D	B	b	z	£
180	2.4	1.6	12+2	128.67
200	2.4	1.6	14+2	128.67

22BA30T3

Rip-saw blade with extra small cutting width

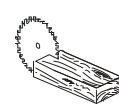

22BA26

Rip-saw blade with a closer tooth pitch. Suitable for both hard and soft wood.

Swedex offer a wide range of saw-blades for ripping both hard & soft wood. Alternate bevelled tooth design is recommended when ripping hard wood.

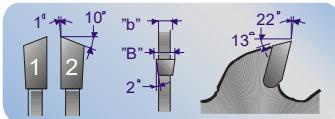

Universal Blades

22BA19

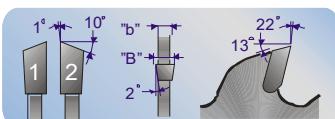

Universal saw blade for most common saw operations but primarily suitable for ripping wood in thinner sections. Suitable for both hard and soft wood.

Blades for cross-cutting of wood and for
trimming and panel sizing of
chipboards, laminated or non-laminated boards.

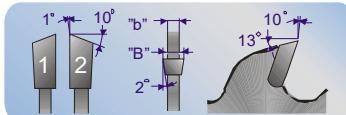

Cross-cut, Trim & Panel sizing

10BA19

Cross-cut, trimming and panel saw blade for hard-board, plasterboard and chipboard etc.
Also manufactured with a 5 degree negative hook angle.

BLADE FACT

Frequently asked questions

What can I do to obtain a better cutting surface finish?

- Choose a saw blade with more teeth.
- Use a higher peripheral speed.
- Select a saw blade with different tooth shape.
- Check flanges and distances.
- Condition of the spindle bearings.

The blade is very noisy, especially when idling, why?

- The blade goes into oscillation (self-vibration).
- Change number of teeth and diameter.
- Adjust the speed of revolution if possible.
- You can also choose a sound absorbing saw blade.
- A coating of sound absorbing material on the inside of the safety cover.

How to avoid chip outs on the bottom side of the material?

- Use a saw blade with more teeth.
- The saw blade is positioned too high above the material.
- Some special grindings and angles may help.

Why does the saw blade wobble when warm?

- During cutting the saw blade becomes warm, especially in the periphery, which causes the blade to expand and stretch. We can add slots for improved blade properties to meet a specific customer's needs.

How to avoid the blade chopping when cutting aluminium?

- When using manual feed, a negative hook angle results

BLADE FACT

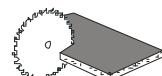

Carbide tips are made out of a metallic material consisting of hard grains of carbide held together by a binding agent. The most common carbide is tungsten carbide and the most common binding agent is cobalt. To improve toughness, the binding agent is sometimes alloyed with other metallic elements.

Carbides are chemical alloys of one or more metals and consist of very small grains. The grain size varies from 1 to around 7 microns (1 micron = 0.001 mm).

The hardness of the carbide tip is adjusted by the size of grain. Harder carbide gives a longer wear resistance but will be more brittle. Larger

BLADE FACT

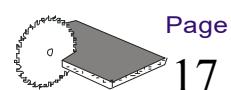

A carbide tipped blade is a precision tool that requires careful maintenance to ensure a long ~~seav~~ life and good performance throughout its life.

The blade must be re-sharpened at the right time, i.e. when the cut surface becomes unacceptable. This usually happens when the tip edge radius exceeds 0.1 mm or when the cutting edge becomes chipped. Normally a carbide tipped blade can be re-sharpened 20-25 times depending on the size of the carbide tips.

Clean the blade regularly to remove the coating of chips and resin that sticks to cutting edges, gullets and saw body. The coating increases the friction as well as the temperature and causes the blade to run hot and twist. The increased wear may in the worst case cause the blade to crack. We recommend the use of a good cleaning agent.

Blades for vertical panel sizing,
e.g. Holz-Her, Striebig
etc.
For laminated or
varnished boards.

Panel sizing saw blades(Wide kerf)

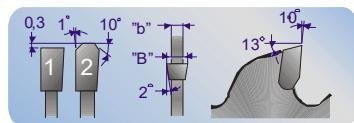

Panel sizing saw blades for use with a scribing unit. The blades have a laser damped saw body and are equipped with long life carbide teeth, which results in a longer time between sharpening.

BLADE FACT

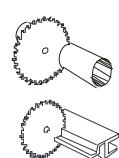

When cutting plastics the saw blade should be placed about 10-15 mm above the material.

For thin, hard plastics we recommend alternately beveled teeth with chamfer (BAE).

For Non-ferrous metals such as aluminum, copper and brass and also for plastics etc. Positive hook angle is used for automatic feed i.e. the material is gripped and negative used for manual feed.

For Non-ferrous metals such as aluminium, copper and brass and also for plastics etc. Positive hook angle is used for automatic feed where the material is clamped and negative is used for manual feed.

The 'Highline' blades for non-ferrous metals are used when the demand for quality, function and performance is paramount. The 'Highline' blade with its optimised variable pitch geometry and reduced noise levels through its damped slits and finish allows the blade to operate at a higher rpm and to accept larger lateral loads. It is suitable for non-ferrous metals, plastic, aluminium, copper, brass etc.

BLADE FACT

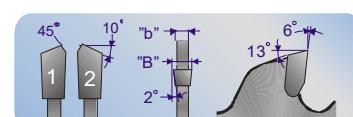

When cutting plastics
the saw blade should
be placed about 10-15
mm above the
material.

For thin, hard plastics
we recommend
alternately beveled
teeth with chamfer
(BAE).

BLADE FACT

The steel used in our saw blades is of the highest quality. It is a spring steel hardened to give the saw body additional strength and stability.

The steel is laser cut and thereafter tempered to receive the correct hardness, depending on the application and use of the saw blade.

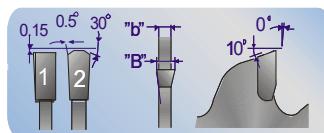

Steel cutting saw blades

Dry cut blades equipped with special carbide tips suitable for sawing steel without cooling.
